CODE REVIEW

HISTORY

Meets Specifications

Congratulations on passing the project! 🎉

You implemented all the necessary changes and have passed the project as a result.

I wish you the best of luck for the rest of the Nanodegree! Happy learning! 📖

Code Quality

All code cells can be run without error.

Appropriate data types (e.g. strings, floats) and data structures (e.g. lists, dictionaries) are chosen to carry out the required analysis tasks.

Loops and conditional statements are used to process the data correctly.

Packages are used to carry out advanced tasks.

Functions are used to reduce repetitive code.

Docstrings, comments, and variable names enable readability of the code.

Script and Questions

Raw input is solicited and handled correctly to guide the interactive question-answering experience; no errors are thrown when unexpected input is entered.

Descriptive statistics are correctly computed and used to answer the questions posed about the data. Raw data is displayed upon request by the user in this manner: Script should prompt the user if they want to see 5 lines of raw data, display that data if the answer is 'yes', and continue these prompts and displays until the user says 'no'.

Statistics are correctly calculated, and the raw data is displayed to users upon request. 🌟 Thanks for adding the functionality mentioned in the previous review in short time!
